	This application relates to a method of how to prevent peak current in the display memory						
	device which comprises arrays of memory cells, pairs of bit and bit bar line, 1st transfer						
	gate, 2nd transfer gate, and data buffers. The solution of claims $1-14$ is characterized in that signals switching the second transfer gates are derived from a single enable						
	signal, divided into several groups, and the signal for each group has a different time						
	delay.	٠.					
ł							
	D1 and D2 are regarded as the closest prior arts because they recognize the problem of						
	peak current in the display driving circuit. But they do not disclose nor even suggest a						
١	display memory device which comprises arrays of memory cells, pairs of bit and bit bar line, 1st transfer gate, 2nd transfer gate, and data buffers, wherein signals switching
